

FIGHT the BITE to

PREVENT the SPREAD

- Did you know that the Zika Virus is spread by the mosquito *Aedes* that lives and reproduces in containers of water?
- Spraying with insecticide is ineffective with “container mosquitoes” making it everyone’s responsibility to prevent Zika Virus by emptying containers of water where *Aedes* can breed.
- Perform weekly inspections of your home and yard to remove any standing water that is accumulating to prevent the transmission of mosquito-borne diseases like Zika Virus.
