Introduction

According to the Florida Legislature Office of Economic and Demographic Research¹, Palm Beach County is Florida's 3rd most populous county, with 6.9% of Florida's population. In addition to its' year round and seasonal residents, Palm beach County has several million visitors per year. If any person, resident or visitor, dies within Palm Beach County, and the circumstances of the death fulfill the criteria defined by Florida Statute 406.11, they will be referred to the Palm Beach County Medical Examiner Office for investigation of the circumstances.

The Palm Beach County Medical Examiner's Office (PBCMEO), District 15 of the Florida Medical Examiner system, is responsible for determining the cause and manner of death of people who die in Palm Beach County and fulfill the criteria of Florida Statute 406.11². The medical examiner shall "make or have performed such examinations, investigations, and autopsies as he or she shall deem necessary or shall be requested by the state attorney" based on the following criteria of Florida Statute 406.11:

- (a) When any person dies in the state:
 - 1. Of criminal violence
 - 2. By accident
 - 3. By suicide
 - 4. Suddenly, when in apparent good health
 - 5. Unattended by a practicing physician or other recognized practitioner
 - 6. In any prison or penal institution
 - 7. In police custody
 - 8. In any suspicious or unusual circumstance
 - 9. By criminal abortion
 - 10. By poison
 - 11. By disease constituting a threat to public health
 - 12. By disease, injury or toxic agent resulting from employment
- (b) When a dead body is brought into the state without proper medical certification
- (c) When a body is to be cremated, dissected, or buried at sea.

The Palm Beach County Medical Examiner Office is located at 3126 Gun Club Road, in West Palm Beach. This facility includes medical examination areas, evidence and specimen storage areas, tissue procurement area, X-ray facilities, as well as administrative areas and offices. The Office is open during normal business hours and observes Federal holidays.

In 2017, 3087 deaths were reported to the PBCMEO. This included 937 cases investigated and determined to NOT fulfill the criteria of F.S. 406.11. These are called non-medical examiner (non-ME) cases. The PBCMEO reviewed the death certificates of 7913 decedents who were to be cremated to determine if any fulfilled the criteria of F.S. 406.11 and thus become a medical examiner (ME) case. Of those 7913 cremation reviews in 2017, 59 (0.7%) became ME cases because they fulfilled the criteria of F.S. 406.11. The total number of ME cases in 2017 was 2144. The 2017 annual report concentrates on the 2144 medical examiner (ME) cases.

County Demographics

According to the U.S. Census Bureau³, the population of Palm Beach County in 2017 was estimated to be 1,471,150. This is an 11.4 % increase since the 2010 census. 51.7 % of the population is female. Five percent of the population is under 5 years of age, while 23.3 % are over 65 years old. Non-Hispanic white is the most common race (56 %), followed by Hispanic or Latino (21.5 %), Black (19.4 %), and Asian (2.8 %). Foreign born persons made up 23.8 % of the population. Of those individuals under age 65 years, 16.3 % had no health insurance. The median household income (in 2016 dollars) is \$55,277 with 12.6 % of the population living in poverty. According to the Homeless Coalition⁴, 1,607 individuals and families are homeless on any given day in 2017, an 11.5% increase from 2015.

Workload

Graph 1: Total ME cases vs. PBC population

Graph 1 shows the total number of ME cases from 2008-2017 compared to the population of Palm Beach County over the same time period.

The dramatic increase in the total number of ME cases from 2014 to 2017 is due largely to fatal opioid overdoses.

Manner of Death

For death certification, each death must be assigned an appropriate manner of death (Figure 1). The assignment of a manner of death is for public health purposes, although other entities (state attorney,

³ <https://www.census.gov/quickfacts/fact/table/palmbeachcountyflorida/PST045216>

⁴ <https://www.homelesscoalitionpbc.org/p/12/facts-and-figures#.WvztOoiUuUk>

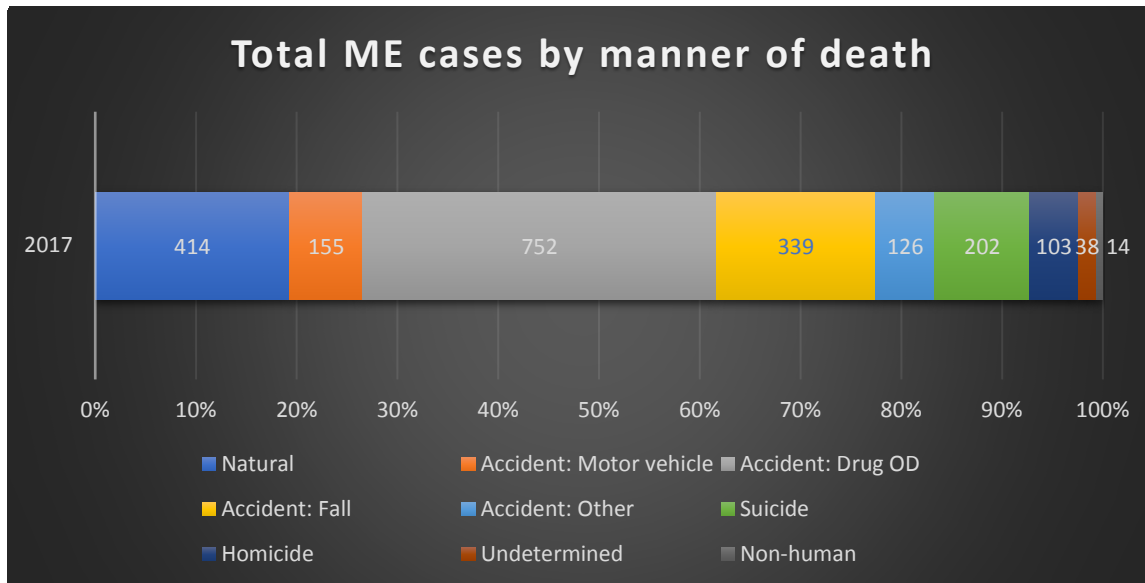

insurance companies, etc.) may use this determination for their own purposes. The manners of death are natural, accident, suicide, homicide, and undetermined. Natural death is one that is entirely caused by a disease without contribution by any injury. If the manner of death cannot be determined because there is more than one reasonable choice, then it is undetermined.

Figure 1: Florida death certificate with manner and cause of death sections

	a. _____				
	b. _____				
c. _____					
d. _____					

Graph 2: Total ME cases by the manner of death

Graph 2 shows the proportion of death by the manner of death in 2017. We further break down the accidental deaths into those involving motor vehicles, drug overdoses, falls, and the other types of accidents such as drownings, etc. Finally, we also include non-human remains or archeologic specimens that were examined in 2017.

In 2017, The majority (64%) of ME cases were accidents, and most of the accidents were fatal drug overdoses (55%). Motor vehicle fatalities constituted 11% of all accidents and falls another 25% of accidents. The majority of fatal falls resulted in head injury and occurred in elders who were often taking anticoagulant medication or “blood thinners.” In 2017, 5% of ME cases were homicides, and 9% were suicides.

Homicides

For death certification, homicide is defined as death at the hands of another person. Homicide determination is not a legal decision. The state attorney and investigative law enforcement agency will determine if and what criminal charges will be brought forth, not the medical examiner.

Graph 3: Annual homicide totals for 2008-2017

The average annual number of homicides for the last ten years is 97. In 2017, there were 13 more homicides than the annual average. The male: female ratio for homicide victims in 2017 was 5.4: 1. Most 2017 homicide victims were blacks (67), followed by whites (28) and Hispanic/Latino (11). The age distribution of homicide victims is seen in graph 4.

Graph 4: Age distribution of homicide victims in 2017

The most common means or instrument of death in the 2017 homicides was the gun, as seen in graph 5.

Guns far exceeded stabbings or beatings as the means to kill another person in 2017. It may be surprising to some that no strangulations, suffocations, poisonings, or drownings were used to kill another person in 2017. Guns are much more efficient killing instruments that do not require proximity, intimacy, or subterfuge to accomplish the task.

Graph 5: Types of homicides in 2017

Suicides

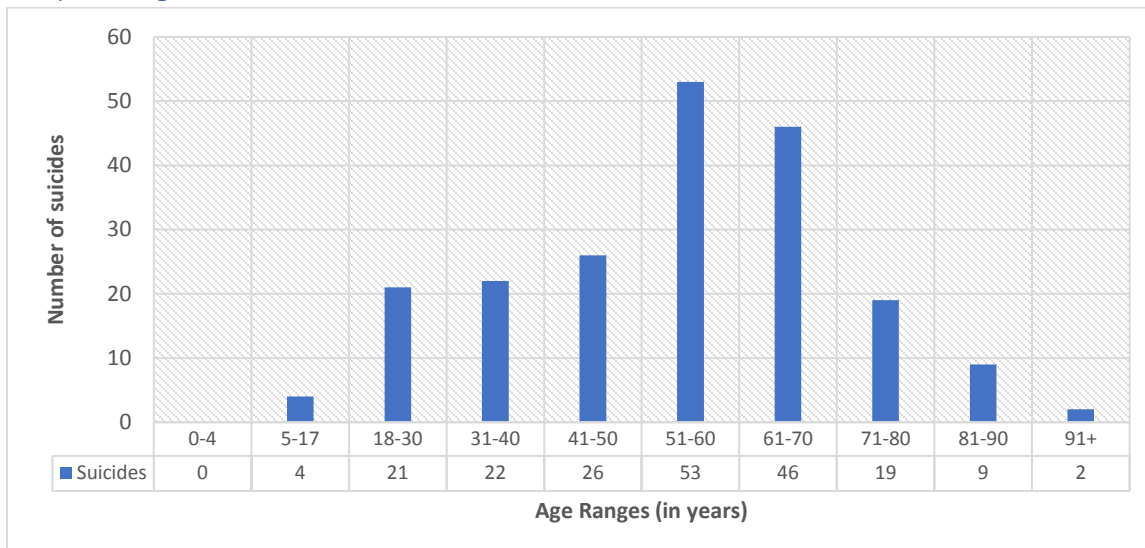

For death certification, suicide is defined as death at one's own hands.

Graph 6: Annual suicide totals for 2008-2017

The average annual number of suicides for the last ten years is 213. In 2017, there were 11 fewer suicides than the annual average. The male: female ratio for suicide victims in 2017 was 2.5: 1. Most 2017 suicide victims were white (178), followed by black (13), Hispanic/Latino (9) and Asian (2). The average age of a suicide victim is 54 years. The age distribution of suicide victims is seen in graph 7.

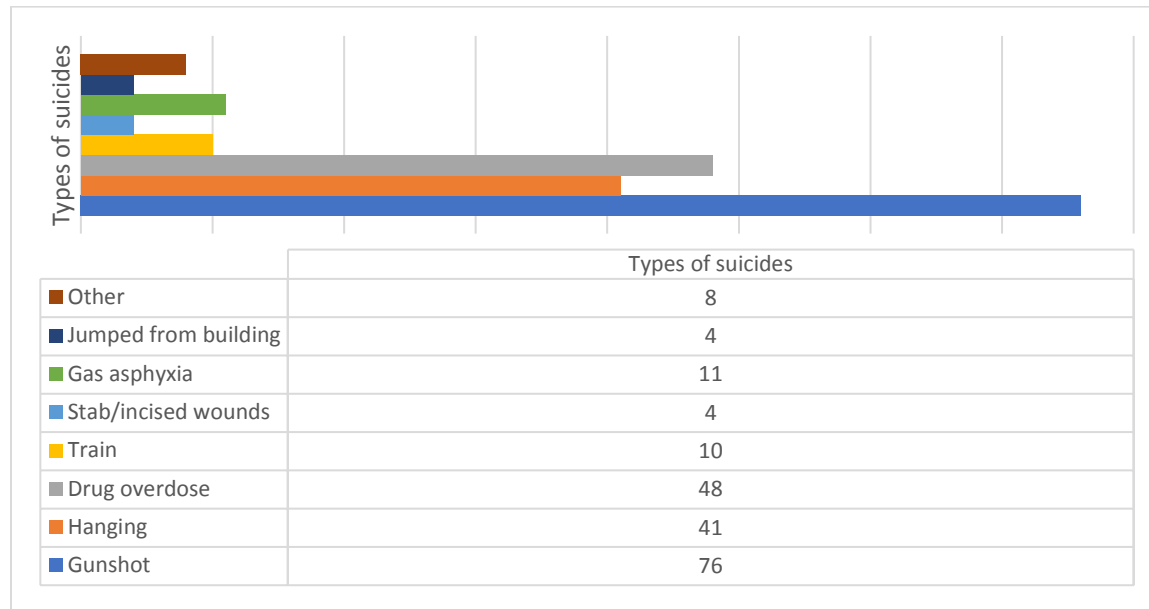

Graph 7: Age distribution of suicide victims in 2017

The most common means or instrument of death in the 2017 suicides was the gun, as seen in graph 8.

In 2017, guns exceeded drugs and hanging as the preferred means to kill yourself. Gas asphyxia included seven people who died from carbon monoxide poisoning (usually car exhaust) and four who used helium gas while wearing a plastic bag over their heads. The other types of suicide included cars (3), drowning (2), immolation by gasoline (2) and a plastic bag over their head alone (1).

Graph 8: Types of suicides in 2017

Accidents

Accidents are deaths that result from an unintentional injury. In this report, we further break down the accidents into three large subgroups: deaths from motor vehicle collisions, drug overdoses, and falls. These subgroups will be explored in greater detail later. In graph 9, the marked increase in accidental deaths from 2014 to 2017 is due to the rise in drug, predominantly opioid, fatalities.

Graph 9: Annual accident totals for 2008-2017

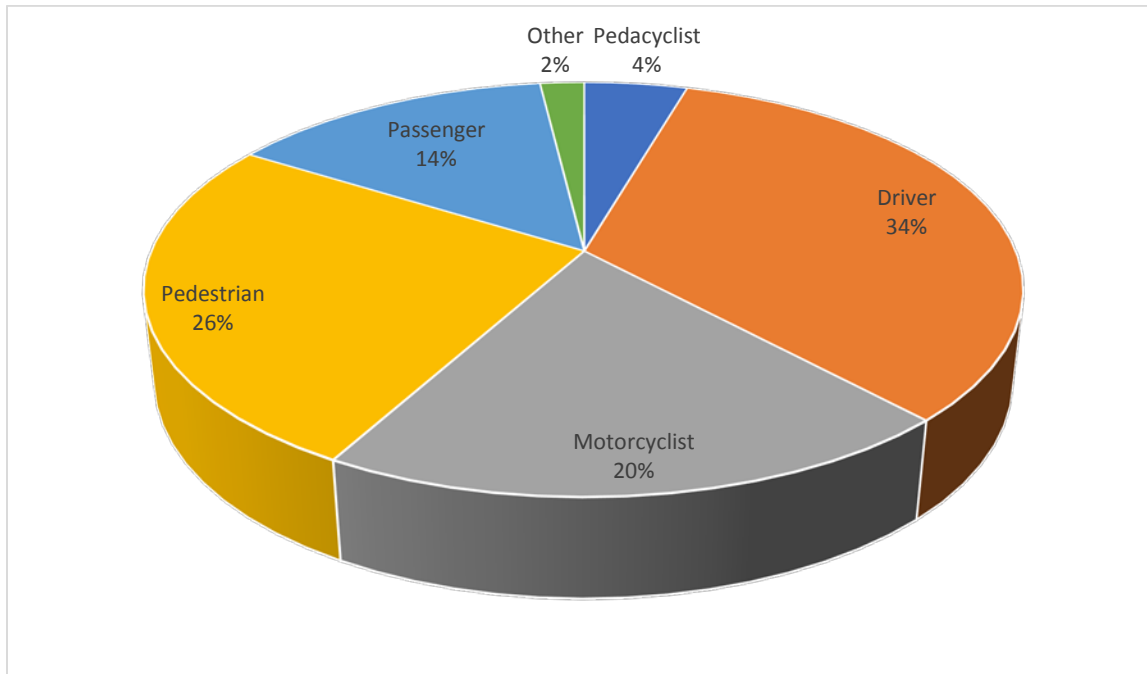

Accidents: Motor Vehicle Fatalities

Graph 10: Annual motor vehicle fatality totals for 2008-2017

There were 155 motor vehicle fatalities in Palm Beach County for 2017. Graph 10 shows the annual number of motor vehicle deaths from 2008 to 2017. In 2017, 34% of those killed in motor vehicle collisions were driving a car or truck. The remaining victims' percentages are seen in Graph 11. In 2017, men were 3.4 times as likely to die in a motor vehicle collision than women. Whites were five times more likely to die in a motor vehicle crash than blacks or Hispanics. The average age of the victims was 49 years old. The age distribution by decades is seen in graph 12.

Graph 11: Victims of 2017 Motor Vehicle Fatalities

Graph 12: Age Distribution of Motor Vehicle Fatalities in 2017

Accidents: Drug Overdoses

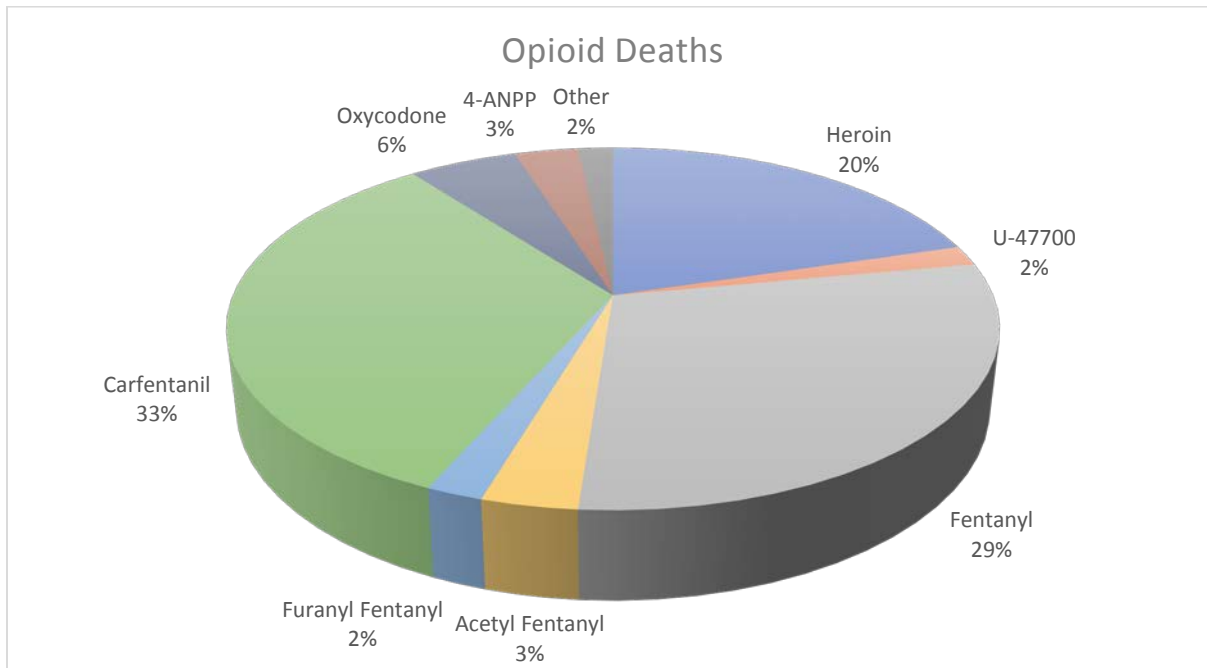

If a drug or drugs accidentally caused or contributed to the death of a person, then this was counted as an accidental drug death. Alcohol is considered a drug along with illicit (i.e., heroin, cocaine), prescription, and non-prescription medications. Opioids are a subset of both illicit (i.e., heroin) and prescription medications (i.e., oxycodone). Suicidal drug overdoses are not included in these graphs as well as those drug overdoses in which the manner of death was undetermined.

Graph 13: Annual drug overdoses totals for 2008-2017

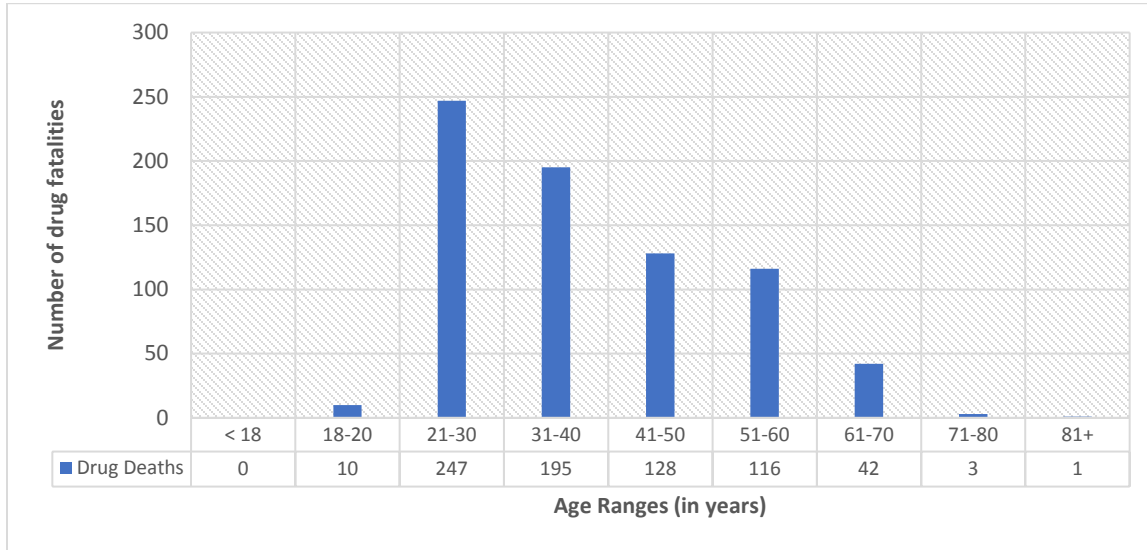

In 2017, there were 752 accidental drug fatalities, of which 611 involved one or more opioid drugs. The relative percentage of opioid drugs causing or contributing to the 611 drug fatalities in 2017 is seen in graph 14.

Graph 14: Opioid Drugs in Accidental Deaths, 2017

Fentanyl and its analogs (carfentanil, furanyl fentanyl, acetyl fentanyl and 4-ANPP) far exceeded the other opiates (such as heroin and oxycodone) in their capacity to kill. In 2017, the average age of drug fatality victims was 38 years. The age distribution of those dying from a drug overdose is seen in graph 15. The victims were predominantly men (2.9:1 men:women) and whites were ten times more likely to die of a drug overdose than all other races.

Graph 15: Age Distribution of Drug Overdose Fatalities in 2017

Accidents: Falls

Like drug fatalities, fatal falls continue to rise over recent years as seen in graph 16. The vast majority of these deaths occur in unstable elders who fall from a standing position. Women often have osteoporosis and are more likely to fracture their hip. Men with heart disease who are treated with anticoagulants are more likely to struck their head leading to fatal brain hemorrhage.

Graph 16: Annual fatalities caused by falls totals for 2008-2017

Deaths with an Undetermined Manner of Death

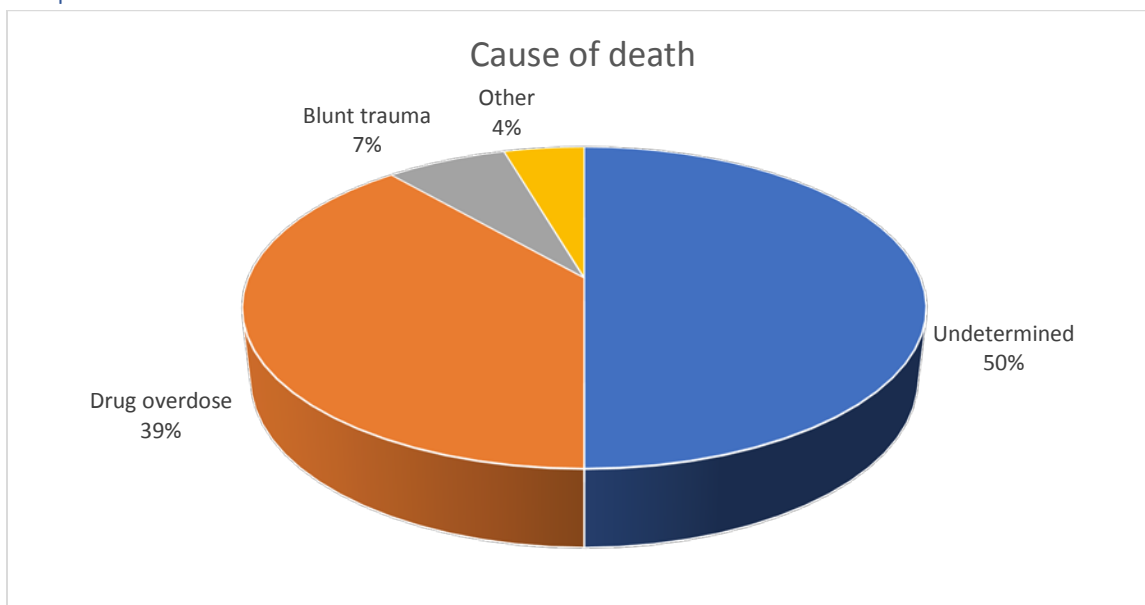

The manner of death is how the death came about and is for death certification and public health purposes. The manners of death are natural, accident, suicide, homicide, and undetermined. If the manner of death cannot be determined because there is more than one reasonable choice, then it is undetermined. The annual number of deaths with an undetermined manner from 2008 to 2017 is seen in graph 17.

Graph 17: Annual undetermined death totals for 2008-2017

In 2017, there were 38 deaths in which the manner of death could not be determined. The causes of death in these cases are seen in graph 18.

Graph 18: Causes of Death in 2017 Undetermined Manner of Death Cases

Natural Deaths

A natural death is one that is entirely caused by a disease without contribution by any injury. The annual number of natural deaths from 2008 to 2017 is seen in graph 19.

Graph 19: Annual natural death totals for 2008-2017

In 2017, the majority of natural deaths investigated by the medical examiner were due to heart disease as this is most likely to kill suddenly without any previous signs or symptoms. Graph 20 shows the diseases that caused natural deaths and examined by the medical examiner in 2017.

Graph 20. Causes of Natural Death Examined by the Medical Examiner in 2017

The average age of those persons who died in 2017 of natural disease was 62 years with a range of 4 to 99 years. Men outnumbered women 2 to 1. Graph 21 shows the relative proportions of people who died of natural disease by their race.

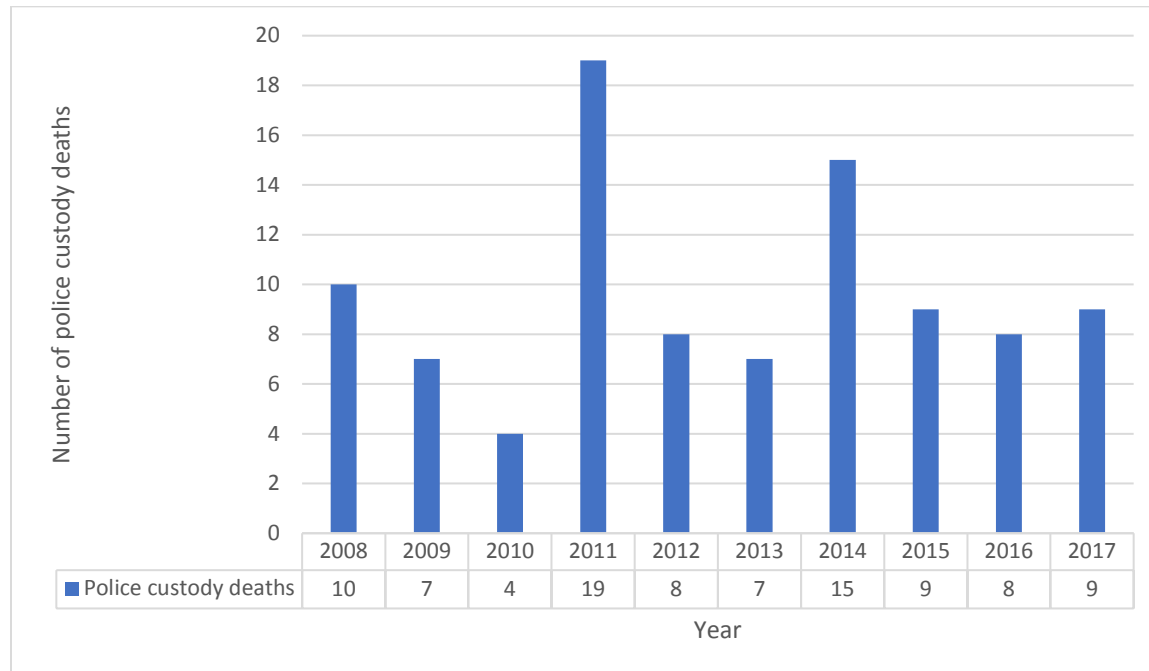

Graph 21: Race of Decedents Who Died of Natural Disease

Deaths in Police Custody

Deaths in police custody are of two broad categories: law enforcement involved and penal institution, as defined by the Florida Medical Examiner Commission. In 2017, nine men died in police custody. Four men died of a natural disease while in jail or prison. Their ages ranged from 40 to 79 years. Another man died accidentally when he jumped out of a moving prison transport truck during a hurricane evacuation. Four men died after the police confronted and chased them as part of their official law enforcement capacity, but before arrest or incarceration. Police shot two men after separate confrontations. One mentally ill man shot himself after he was chased and cornered by the police. Finally, one man accidentally drowned in a canal after he fled the police who came to his house to arrest him.

Graph 22: Annual police custody deaths totals for 2008-2017

Infant Deaths

An infant is a child under the age of one year. Graph 23 shows the number of infant deaths from 2008 to 2017.

Graph 23: Annual infant deaths totals for 2008-2017

In 2017, nine infant deaths were investigated by the Palm Beach County Medical Examiner’s office. Seven infants were girls. Seven infants were white and the remaining two were black. The age range was 1-11 months and the average age was 4.2 months. Three deaths were due to accidental suffocation by an adult sleeping with the infant in an adult bed. One death was due to Sudden Infant Death Syndrome (SIDS). The remaining five deaths were undetermined after a complete autopsy, toxicology testing and scene examination with doll re-enactment.

Child Deaths

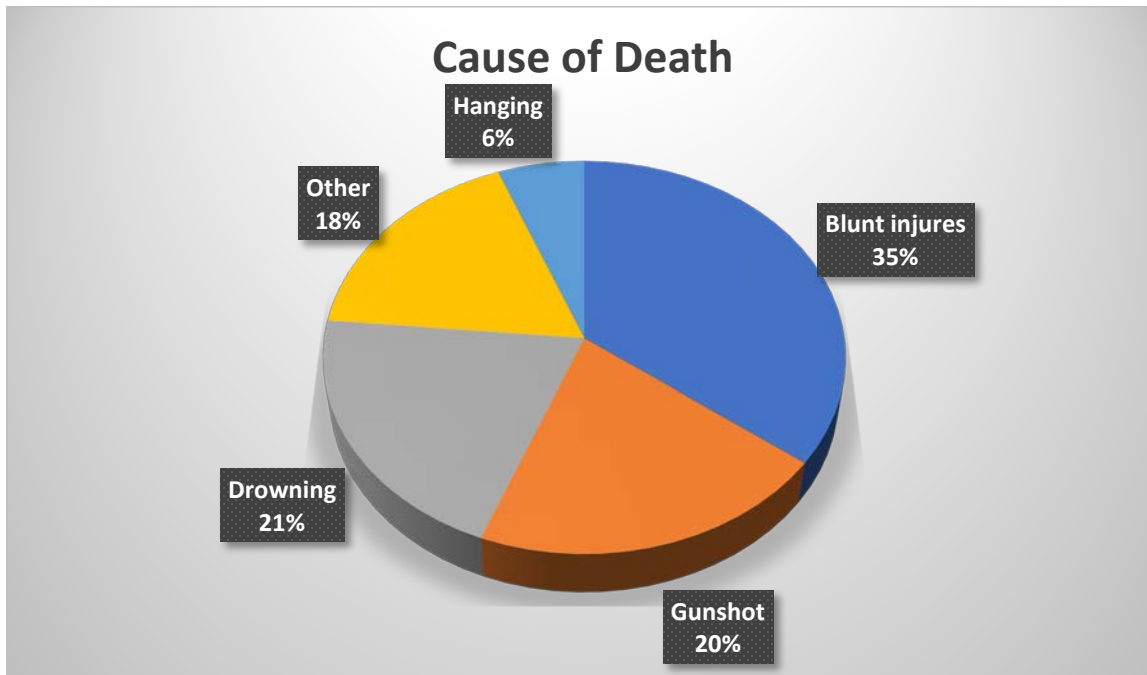

For our purposes, a child is greater than 1 year old, but less than 18 years of age. By this definition, 34 child deaths were investigated by the Palm Beach County Medical Examiner’s office in 2017. The average age was 10.5 years and the age distribution of child deaths in 2017 as seen in graph 23. The ratio of boys to girls was 2.4 to 1. There 16 black children, 14 whites and 4 Hispanic/Latino.

Graph 24: Age distribution in children who died in 2017

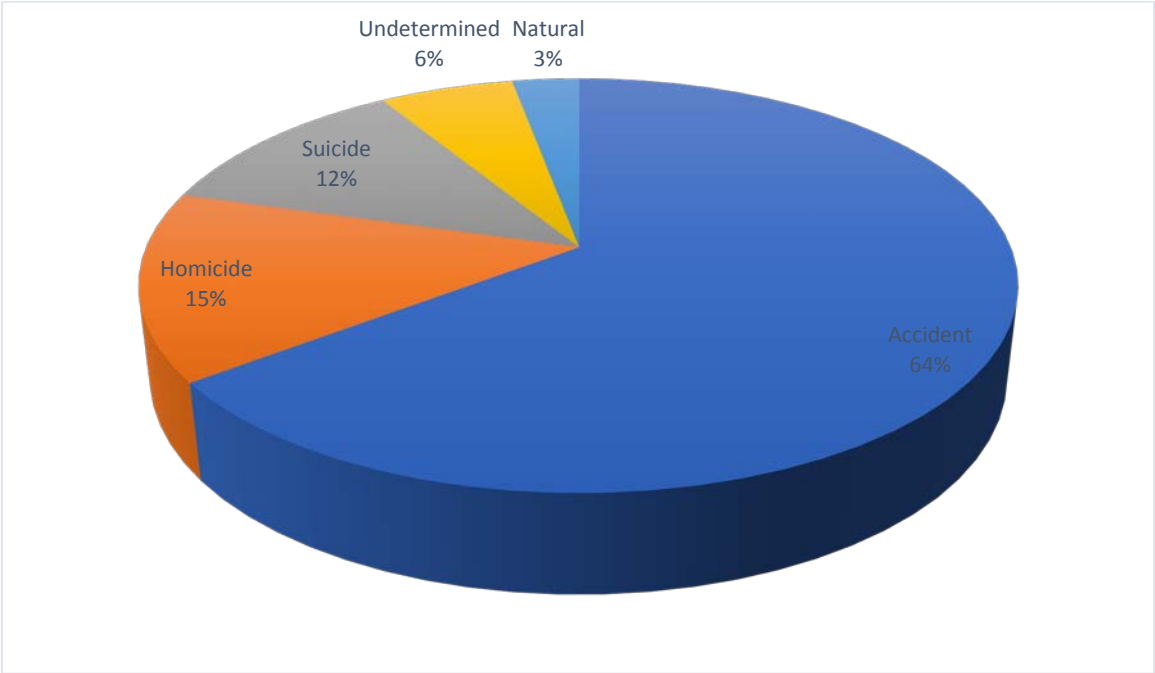

The distribution of cases by cause and manner of death are seen in graphs 25 and 26.

Graph 26: Cause of Death in Child Deaths in 2017

Graph 26: Manner of Death in Child Deaths in 2017
